Chapter 10: File-System Interface

Chapter 10: File-System Interface

- File Concept
- Access Methods
- Directory Structure
- File-System Mounting
- File Sharing
- Protection

Objectives

- To explain the function of file systems
- To describe the interfaces to file systems
- To discuss file-system design tradeoffs, including access methods, file sharing, file locking, and directory structures
- To explore file-system protection

File Concept

- Contiguous logical address space
- Types:
 - Data
 - numeric
 - character
 - binary
 - Program

File Structure

- None sequence of words, bytes
- □ Simple record structure (文本文件, C, C++...)
 - Lines
 - Fixed length
 - Variable length
- □ Complex Structures (DOC文件...)
 - Formatted document
 - Relocatable load file
- Can simulate last two with first method by inserting appropriate control characters
- Who decides:
 - Operating system
 - Program

File Attributes

- Name only information kept in human-readable form
- Identifier unique tag (number) identifies file within file system
- □ **Type** needed for systems that support different types
- Location pointer to file location on device
- Size current file size
- Protection controls who can do reading, writing, executing
- Time, date, and user identification data for protection, security, and usage monitoring
- Information about files are kept in the directory structure, which is maintained on the disk

File Operations

- File is an abstract data type
- Create
- Write
- Read
- Reposition within file
- Delete
- Truncate
- □ $Open(F_i)$ search the directory structure on disk for entry F_i , and move the content of entry to memory
- □ Close (F_i) move the content of entry F_i in memory to directory structure on disk

Open Files

- Several pieces of data are needed to manage open files:
 - File pointer: pointer to last read/write location, per process that has the file open
 - File-open count: counter of number of times a file is open – to allow removal of data from open-file table when last processes closes it
 - Disk location of the file: cache of data access information
 - Access rights: per-process access mode information

File Types – Name, Extension

file type	usual extension	function	
executable	exe, com, bin or none	ready-to-run machine- language program	
object	obj, o	compiled, machine language, not linked	
source code	c, cc, java, pas, asm, a	source code in various languages	
batch	bat, sh	commands to the command interpreter	
text	txt, doc	textual data, documents	
word processor	wp, tex, rtf, doc	various word-processor formats	
library	lib, a, so, dll	libraries of routines for programmers	
print or view	ps, pdf, jpg	ASCII or binary file in a format for printing or viewing	
archive	arc, zip, tar	related files grouped into one file, sometimes compressed, for archiving or storage	
multimedia	mpeg, mov, rm, mp3, avi	binary file containing audio or A/V information	

Access Methods

Sequential Access

```
read next
write next
reset
no read after last write
(rewrite)
```

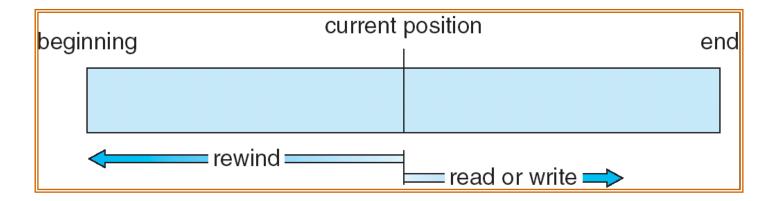

Direct Access

```
read n
write n
position to n
read next
write next
rewrite n
```

n = relative block number

Sequential-access File

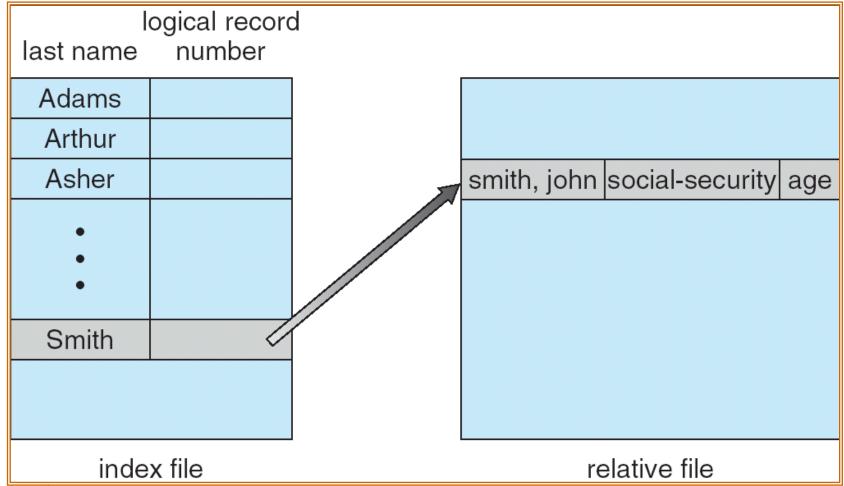

Simulation of Sequential Access on a Direct-access File

sequential access	implementation for direct access		
reset	cp = 0;		
read next	read cp ; cp = cp + 1;		
write next	write cp ; $cp = cp + 1$;		

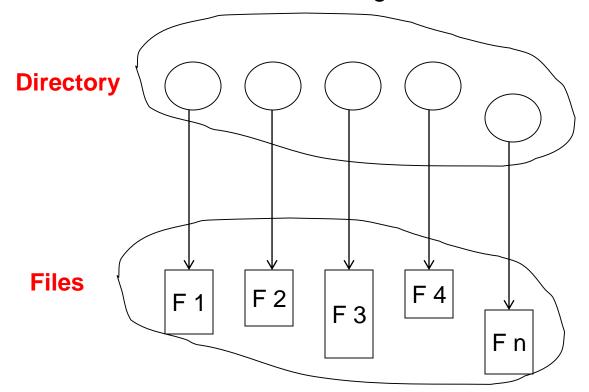

Example of Index and Relative Files

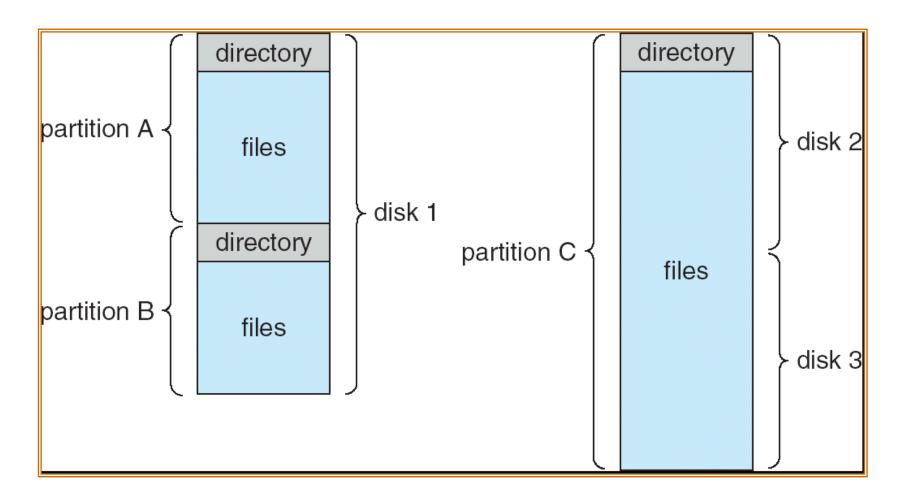

Directory Structure

A collection of nodes containing information about all files

Both the directory structure and the files reside on disk Backups of these two structures are kept on tapes

A Typical File-system Organization

Operations Performed on Directory

- Search for a file
- Create a file
- Delete a file
- List a directory
- Rename a file
- Traverse the file system

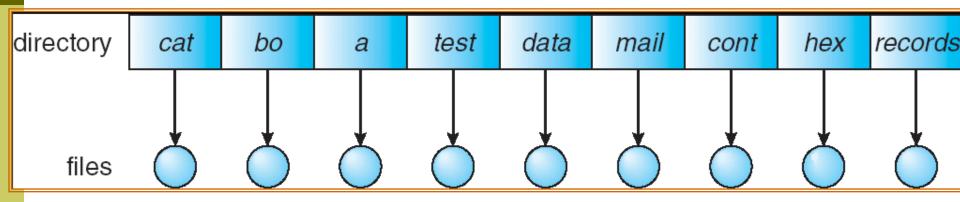

Organize the Directory (Logically) to Obtain

- Efficiency locating a file quickly
- Naming convenient to users
 - Two users can have same name for different files
 - The same file can have several different names
- □ Grouping logical grouping of files by properties, (e.g., all Java programs, all games, ...)

Single-Level Directory

A single directory for all users

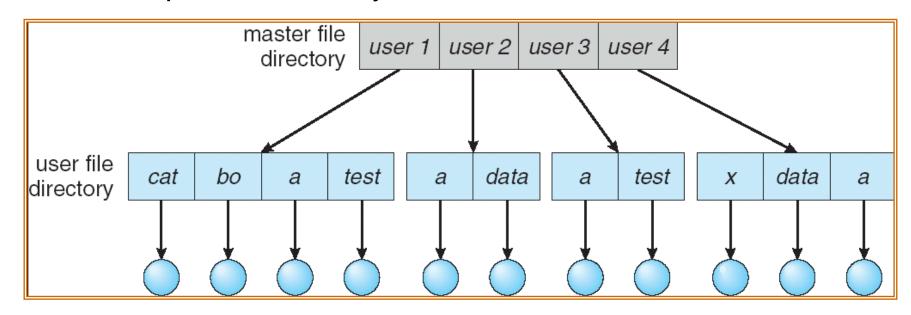

Naming problem

Grouping problem

Two-Level Directory

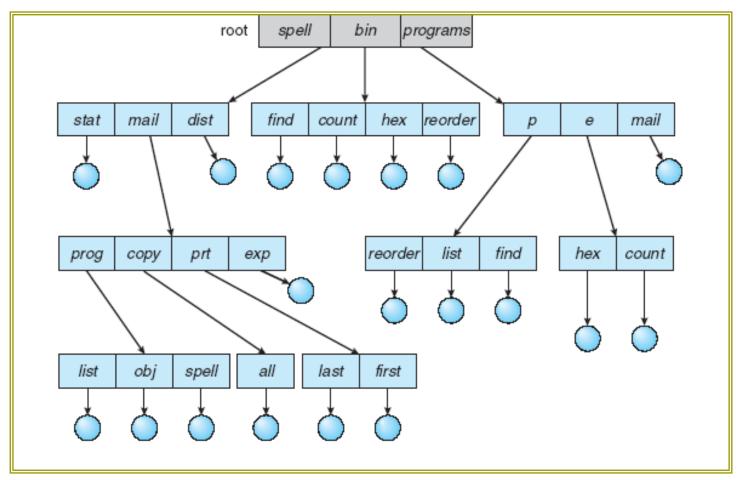

Separate directory for each user

- Path name
- Can have the same file name for different user
- Efficient searching

Tree-Structured Directories

Tree-Structured Directories (Cont)

- Efficient searching
- Grouping Capability
- Current directory (working directory)
 - cd /spell/mail/prog
 - type list

Tree-Structured Directories (Cont)

- Absolute or relative path name
- Creating a new file is done in current directory
- Delete a file

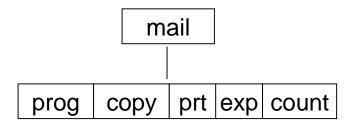

rm <file-name>

Creating a new subdirectory is done in current directory

mkdir <dir-name>

Example: if in current directory /mail

mkdir count

Deleting "mail" ⇒ deleting the entire subtree rooted by "mail"

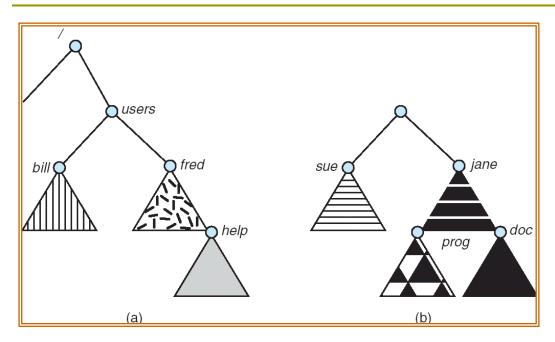

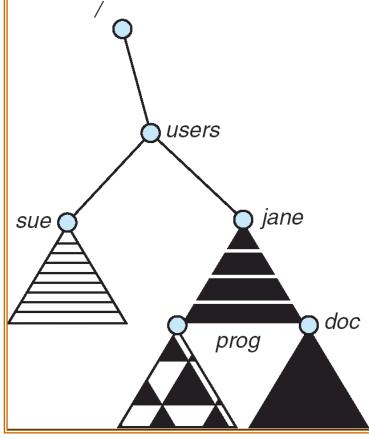

File System Mounting

- A file system must be mounted before it can be accessed
- A unmounted file system (i.e. Fig. 11-11(b)) is mounted at a mount point

(a) Existing. (b) Unmounted Partition

File Sharing

- Sharing of files on multi-user systems is desirable
- Sharing may be done through a protection scheme
- On distributed systems, files may be shared across a network
- Network File System (NFS) is a common distributed file-sharing method

File Sharing – Multiple Users

- User IDs identify users, allowing permissions and protections to be per-user
- Group IDs allow users to be in groups, permitting group access rights

Protection

- □ File owner/creator should be able to control:
 - what can be done
 - by whom
- Types of access
 - Read
 - Write
 - Execute
 - Append
 - Delete
 - List

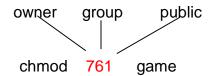

Access Lists and Groups

- Mode of access: read, write, execute
- Three classes of users

			RWX
a) owner access	7	\Rightarrow	111
,			RWX
b) group access	6	\Rightarrow	110
, •			RWX
c) public access	1	\Rightarrow	0 0 1

- Ask manager to create a group (unique name), say G, and add some users to the group.
- For a particular file (say game) or subdirectory, define an appropriate access.

Attach a group to a file

chgrp G game

A Sample UNIX Directory Listing

-rw-rw-r	1 pbg	staff	31200	Sep 3 08:30	intro.ps
drwx	5 pbg	staff	512	Jul 8 09.33	private/
drwxrwxr-x	2 pbg	staff	512	Jul 8 09:35	doc/
drwxrwx	2 pbg	student	512	Aug 3 14:13	student-proj/
-rw-rr	1 pbg	staff	9423	Feb 24 2003	program.c
-rwxr-xr-x	1 pbg	staff	20471	Feb 24 2003	program
drwxxx	4 pbg	faculty	512	Jul 31 10:31	lib/
drwx	3 pbg	staff	1024	Aug 29 06:52	mail/
drwxrwxrwx	3 pbg	staff	512	Jul 8 09:35	test/

End of Chapter 10
